

Supplemental Fig. 1

Histological findings of the primary breast cancer.

(a) HE staining, bar 100 μm. The neoplastic cells show a single-file infiltration pattern.

(b) E-cadherin, bar 100 μm. Immunohistochemical analysis revealed attenuated membranous expression of E-cadherin in the ILC areas (aberrant expression pattern). The normal glandular structures served as a positive internal control and showed strong membranous staining.
